Abstract: grounds. Under these conditions the passage of food through their gastro intestinal tract was accelerated to almost double the usual time. A paradox was observed: a marked low rate of metabolism and a decrease of blood circulation when physical strain was imposed on cows (such as the placing of a sand bag weighing 10-20 percent of the body weight on the shoulders of a cow standing in a stall). Productive, choice cows showed a higher oxygen content in their blood.

953. EYE INJURIES AMONG THE FARMING POPULATION OF THE LENIN-GRAD AREA (Russian text) - Yalovaya - Nevinskaya T. A. - TRUDY PROFIL. RAB. I MED. OBL. NAS. LEN. OBLASTI 1956, 1 (41-45)

The proportion of agricultural eye injuries among the population of the area is relatively high. A study of the causes of this has shown that agricultural injuries principally affect metal workers in workshops during repairs to machinery, and much more rarely workers in the fields. In recent years fewer cases of injury to the eye from corn barbs have been observed. The gravity of the outcome of eye injuries depends not only on the gravity of the wound but also on the timely rendering of first aid, and further on the length of the patients' stay in hospital. The high proportion of enucleations is referable to neglected cases where there was extreme delay in referring the patient to hospital. Among defects in this sphere, the author lists inadequate out-patient care for the rural population, non-observance of the safety regulations and lack of health propaganda work on the prevention of injuries to the eyes.

TITLE: Asynchronous liquid metal pump

SOURCE: Byul tekhn-ekon inform, no. 5, 1966, 41-42

TOPIC TAGS: liquid metal pump, current carrier

ABSTRACT: A linear type of asynchronous liquid metal pump, developed by the Moscow Aviation Institute im. S. Ordzhonikidze, is briefly described. The pump has the main advantage of induction pumps, i.e., their contactless feature. In operation, the asynchronous pump does not differ from the conduction pump. However, the role of current carrying busbars is played here by the liquid metal. The accompanying figure shows a cross section of the pump. Linear channel 1 of the pump has a transverse, hermetic grommet 2 not in galvanic contact with the liquid metal. Its surface is coated with thermally insulating layer 3. Magnetic circuit of power transformer 4 passes through the grommet. The primary winding of transformer 5 is fed a-c voltage. Geometrical dimensions of the channel are chosen taking into account the density of the current flowing through the liquid metal. The

TITLE: Electromagnetic flow meter for liquid metals 1⁶

SOURCE: Byulleten' tekhniko-ekonomiceskoy informatsii, no. 6,
1966, 37-38

TOPIC TAGS: flow meter, ~~electromagnetic flow meter~~, liquid metal,
~~liquid metal flow meter~~, liquid metal flow ELECTROMAGNETISM

ABSTRACT: An electromagnetic flow meter for liquid metals has been developed at the Moscow Aviation Institute. The flow meter is intended for use in the alkali metal industry, metallurgical and power industry, and in various purpose hydraulic systems. The sensing elements of the meter never come into contact with the liquid metal. The meter is of simple design, is highly sensitive, and with some modification can be used in automatic control systems of power plants operating under widely varying thermal conditions. Orig. art. has: 1 figure. [DV]

PURPOSE: The collection of reports is intended for the scientific and technical personnel of scientific research institutes, plants and schools of higher education.

CONTENTS: The book is a collection of reports submitted by scientific workers at various scientific institutes and schools of higher education at the third All-Union Scientific Conference on the Automation of Industrial Processes in Machine Building, All-Union Conference on Industrial Drives held in Moscow on May 1-6, 1959. The Conference is called by the Academy of Sciences USSR, the German SSR (the Plenum Commission USSR), the GDR (DDR), the Council of Ministers for Economics (ministries), the State Committee on Automation and Machine Building (Gossnauktechnika), and the National Polytechnical Committee (NTPK) for automation work.

Yaroshevsky (USSR National Committee on Automatic Control), and preprint series of the Technical Committee on Automatic Control (Moscow Institute of Mathematics), the VNIIT (Institute of Automation and Telemechanics) of the Academy of Sciences USSR, and the Institute for Mathematics and Cybernetics of the Ministry of Finance USSR (Commission on the Technology of Sciences USSR).

Including the Institutes of Design of Machines of the Academy of Sciences USSR. It was the purpose of the Editorial Board to arrange the reports in a way which would ensure a relatively systematic presentation of theoretical and practical problems relating to electric drives and automatic controls of industrial machines used in various branches of industry. Basic problems of automatic electric drives and their solutions are outlined. The book also contains articles on electrical machinery and means of orientation. Considerable attention is paid to nonlinear automatic control systems, including systems with semiconductor devices and magnetic amplifiers and to computers dedicated both for the analysis and the synthesis of linear and nonlinear automatic regulation and control systems. In addition, papers in general official publications have been gathered, and also selected those which have appeared in volume V of IZD RP transactions or in the journal "Kibernetika" are included with an asterisk. No personalizations or author's signatures are marked with an asterisk. No personalizations are mentioned.

viral hepatitis

SOURCE: Microbiologia, parazitologia si epidemiologia, v. 10, no. 4, 1965, 361-364

TOPIC TAGS: protein, virus disease, hepatitis, urology

ABSTRACT: The authors show that the percentage of positive tests as well as the
intensity of the concentration of mucoproteins in the urine of patients suffering
from acute viral hepatitis, chronic hepatitis, obstructive jaundice and biliary
dyskinesia is higher when the disease is more serious. It is suggested that this
may also be due to pathologic changes in the kidneys during these diseases.

TITLE: Blast-furnace Operation at a Top Pressure of Over 1 Atmosphere (Gauge) (Rabota domany pechki pri davlenii kholodil'nykh gasov 7kbar 1 stsi)

PUBLICATION: Metallurg, 1956, Nr. 4, p. 6 (USSR).

ABSTRACT: The authors give operating data for Ir 7 blast furnace at the Krivorizhstal' Works smelting pig iron (2.3 - 2.7% Si) from a burden containing 96.7 - 100% sinter and 5.03 - 56.97% Fe for a period (March - October, 1956) when the top pressure was changed monthly in the range 0.46 - 1.15 atm (gauge). After allowing for the changing iron content of the burden, the authors conclude that raising top pressure from 0.46 - 0.71 to 1 - 1.15 atm. (gauge) leads to an increase in furnace productivity of 4 - 7% and a decrease in coke rate of 5 - 9%. The pressure drop through the furnace and flue-dust of production decreased with increasing top pressure. With increased top pressure, the furnace tended to work up the walls and the coke charge was reduced from 6.3 - 6.5 to 5.6 tons. The charging cycles increased and coke was being carried 2/2.

TITLE: Mastering of a High Capacity Blast Furnace

PERIODICAL: Stal', 1959, Nr 9, pp 770-775 (USSR)

ABSTRACT: In September 1958, the largest furnace in the USSR (and Western Europe) was blown in, its working volume 1719 m³. The profile and main dimensions of the furnace are shown in Fig 1. The blast is heated in 4 stoves of 27135 m² heating area each, allowing a blast temperature of 1000 - 1050°C to be maintained. The blast is supplied by a blower of a capacity of 4000 m³/min at 3.8 atm abs. The furnace was operating with about 85% of fluxed sinter (basicity 0.8 - 1.0) containing 40-45% of fines 0 - 12 mm) and a high top pressure of 1.25 to 1.40 atm. Changes in the output, ore load and blast volume during the first months of operation are shown in Fig 2. Furnace operating data for subsequent operation (up to the end of 1958) are given in table 1 and analyses of iron and slag in Table 3. During December 1958, the average daily output of the furnace rose to 2231 tons (7 casts per day) at a coke rate of 749.6 kg/ton and slag volume of 882.5 kg/ton

Card 1/3

SOV/133-59-9-2/31

Mastering of a High Capacity Blast Furnace

(slag basicity 1.26). It was found that the furnace was very sensitive to the degree of filling of the hearth with liquid products (Fig 3). Any retardation in the casting or removal of slag considerably decreases the rate of descent of burden materials. Changes in the composition of the gas phase along the hearth radius (tuyere level) - Fig 4, changes in the CO₂ content of the top gas along the throat radius - Fig 5; operating conditions and material balances for two operating periods - table 3. From the operating experience gained it is concluded that large furnaces can operate efficiently at large outputs. An increase in the sinter basicity of 0.1 increases the output of the furnace by 1.2%. Some deterioration in the size distribution of sinter caused by an increase in basicity did not cause any noticeable deterioration in the furnace operation. An increase in the blast volume of 100 m³/min increases the output by 1.3%. The depth of the combustion zone in the furnace was found to be about 1200 mm which for a furnace of 9100 mm diameter is insufficient and some measures should be taken to increase it. An increase in

Card 2/3

SOV/133-59-9-2/31

Mastering of a High Capacity Blast Furnace

the blast temperature from 840° to 970°C and the moisture content from 30 to 40 g/m³ decreased the coke consumption by 2.6% and increased the output by 3.7%. Whereupon the utilization of carbon monoxide for reduction increased from 39 to 41%, the degree of direct reduction somewhat increased and the participation of hydrogen in the reduction amounted to about 69%. The following deficiencies in the furnace design are listed: a) blast main with three 90° bends which lead to an increase in the pressure drop; b) lack of balance between the capacity of the scale car and skips which causes some difficulties in the furnace charging (not specified) and c) the positioning of tunnels for power cables and water mains in places where, in case of a break out, the penetration of liquid iron is possible. There are 5 figures and 3 tables.

TITLE: With a hand grenade against the tank

SOURCE: Starshina-serzhant, no. 1, 1966, 10-11

TOPIC TAGS: grenade, antitank bomb, military tank, ordnance, ammunition, ground force tactic, ground force training, field exercise

ABSTRACT: The process of training foot troops to fight against tanks with hand grenades is described. A field exercise is conducted under simulated combat conditions in which the trainees are protected from an advancing tank by a specially arranged training trench. The trench is about 150 cm deep and 30 m long. The walls of its 10m middle section are reinforced and lined with fascines or timber boards. A shelter is provided at each end of the trench. A schematic plan of the trench arranged for two prone trainees is presented. The middle trench section is used for tank crossings. The first preliminary stage of training includes the study of tank structure and its vulnerable parts. The trainees are informed that they can not be hit by tank fire at close range (100 m and less). The second stage covers practical exercises in order to make trainees accustomed to use trenches as a protection against tank. During the

Card 1/2

ACC NR: AP6017554

third stage, the trainees are trained to throw training grenades at the tank immediately after its crossing. Various aspects of these three stages are examined and discussed including the safety measures to be taken during the crossing operation. A 4-hour training schedule is presented along with various training equipment. Orig. art. has 2 figures.

TITLE: Beam extraction in a proton synchrotron by generating an azimuthal asymmetry of magnetic field

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1963, 19-21

TOPIC TAGS: beam extraction, proton synchrotron

ABSTRACT: A description is presented of a beam extraction system that generates the first harmonic of azimuthal asymmetry of magnetic field; the system is used in the proton synchrotron at the United Nuclear Research Institute. The disturbing field is built, at the end of the acceleration cycle, by special windings on all four sectors of the ring magnet. The current pulse in the winding is taken from a bank of capacitors which discharges at an appropriate moment of the acceleration cycle. The entire beam, or a part thereof, can be extracted in

Card 1/2

metallurgiya, 1960, Nr 1, pp 84-90 (USSR)

ABSTRACT:

This article describes the application of an experimental method of lead smelting with soda under semi-industrial conditions developed by K. V. Sushkov, Cand. of Techn. Sciences, (Collection of Scientific Works, KazGMI, Nos 10, 12, 16, 1955). Tests were carried out by the experimental shop and lead plant (svintosavyy zavod) of Leningorok Combine (Leningorskii Kombinat) and by Kazakh Mining and Metallurgical Institute (Fazakhskiy gornometallurgicheskiy institut). Smelting was done in a single-phase electrical furnace with a 0.8 m² bottom area, 250 kw transformer

PROCESSES AND PROPERTIES INDEX

6

Sodium fluoroluminates. V. S. Valley. J. Gen. Chem. (U.S.S.R.) 7, 3439-41 (1937).—Partial neutralization of a soln. of 1 mol. $\text{Al}(\text{OH})_3$ in 3 mol. H_3P_t by means of Na_2CO_3 at 70–80°, results in the formation of $\text{Na}_2\text{AlF}_5 \cdot 7\text{H}_2\text{O}$. Neutralization of a 7% eq. soln. of AlF_3 with Na_2CO_3 at 23°, results in the formation of Na_2AlF_5 . In a similar reaction for the prepn. of artificial cryolite, where the assumed formula is Na_2AlF_5 , the actual ratio $\text{NaF} : \text{AlF}_3$ is found to vary between 2.4–2.8. These facts lead to the conclusion that artificial cryolite is a product of reaction between NaF and NaAlF_5 . The NaAlF_5 first sepa. out from soln. and then reacts with varying amt. of NaF . The existence of a hydrate $\text{Na}_2\text{AlF}_5 \cdot 7\text{H}_2\text{O}$, reported in the literature, could not be confirmed.

(In collection: "Metallurgiya i metalloved. chist. metallov",
no. 3, Moscow, Gosatomizdat, 1961, 277 - 283)

TEXT: Described are two universal chambers for diffraction microroentgenography, whereby substructural characteristics of individual metal grains can be obtained. A ДМРК-2 (DMRK-2) chamber is intended for the study of single crystals and polycrystals in the continuous spectrum, in characteristic or monochromatic X-radiation. The special holder design permits the precise reproduction of exposure conditions after a specimen has been replaced. The specimen is able to rotate about an axis coinciding with the monochromator rotation axis. The absolute turning angles are read with an accuracy of $\sim 3'$, and the relative ones with $\sim 6''$. The DMRK-3 chamber provides for the possibility of obtaining an X-ray beam with little divergence in one plane using a fine-focused tube, ✓

TITLE: Furfurhydramide and its vulcanization activity

PERIODICAL: Kauchuk i rezina; no. 2, 1961, 25 - 29

TEXT: The Soviet rubber industry uses diphenylguanidine as a nitrogen-containing accelerator with a basic nature. Its production is based on toxic and inflammable materials (aniline, carbon sulfide, lead silicagels and isopropyl alcohol). An attempt was made to find a cheaper nitrogen-containing organic base. Furfurhydramide was tested in combination with sulfur accelerators as an accelerator of vulcanization. A method for producing the furfurhydramide from cheap and accessible raw material was developed. It is an nitrogen-containing organic base which can be used as a vulcanization accelerator in combination with altax, captax or thiuram. In mixtures based on natural rubber and a series of synthetic rubbers containing diphenylguanidine in combination with altax or captax, furfurhydramide can be used instead of diphenylguanidine. It increases the durability of the

Card 1/5

Furfurylhydramide and its vulcanization activity

vulcanizes in repeated deformations. When it is used in combination with captax, altax or thiuram in mixtures based on natural and a number of synthetic rubbers, the rate of vulcanization does not change and vulcanizates are obtained with satisfactory technical properties. Its use extends the assortment of vulcanization accelerators and decreases the consumption of captax, altax, diphenylguanidine and thiuram. Its physical and chemical characteristics are: finely crystalline powder of straw-yellow color with d_4^{20} 1.15 - 1.16, melting point when crystallized from ethyl ether 117 - 118°C. It is easily soluble in methyl, ethyl and isopropyl alcohol, acetone, ether, benzene, but is insoluble in water. The molecular heat of combustion at P = const. is 1,828.15 cal, at V = const. it is 1,827.87 cal. Acids decompose it to furfurole and ammonium, when boiled in diluted alkali it is converted to the isomer base furfuran. It absorbs ultraviolet rays, whereby its color changes to a dark brown. It has a specific furfurole odor. It is produced from furfurole and ammonium according to the equation:

Card 2/5

20809
S/138/61/000/002/005/008
A051/A129

Furfurhydramide and its vulcanization activity

Commercial furfurhydramide melts at 110 - 115°C. Its nitrogen content is 10.41% calculated and 10.20 - 10.30% found. Obtained data showed that when natural rubber is heated in the presence of furfurhydramide and sulfur, there is a significant decrease of the plasticity, whereas the plasticity of natural rubber containing only sulfur or furfurhydramide hardly changes at all when heated under the same conditions. It is concluded that furfurhydramide strengthens the structuralizing effect of sulfur. It does not affect the inclination of the mixtures to scorching. There are 3 tables, 4 figures and 8 references: 2 Soviet, 4 English and 2 German.

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 6-7, abstract 5K41
("Tr. po khimii i khim. tekhnol.", Gor'kiy, no. 3, 1961, 472-475)

TEXT: Optimum conditions for determining H in Ti with an allowance for the "foreign" H contained in the air were established. To plot graduation diagrams, the blackening of the H₂ 6562.8 Å line was used. The width of the slit was selected 60 μ, and the inductance was 36 μhy; the possibility of applying the background as an internal standard for plotting graduation diagrams was established. To increase the accuracy of the analysis it is desirable to reduce the amount of the "foreign" H, that is, to work with a smaller gap between the electrodes. The air humidity has practically no influence on the "foreign" H concentration.

TITLE: On the Mining of the Dzhezkazgan Deposits Without Leaving
a Protective Ore Crust (O razrabotke Dzhezkazganskogo
mestorozhdeniya bez ostavleniya rudnoy korki)

PERIODICAL: Gornyy zhurnal, 1958, Nr 10, pp 8-11 (USSR)

ABSTRACT: Experimental works conducted jointly by the Unipromed' and
the Administration of the Dzhezkazgan Mines showed that the
introduction of a compulsory caving-in system gave much bet-
ter results than those achieved by the old room-pillar system.
According to the old system it was considered necessary to
leave a protective ore crust, 1 or 2 m thick, in places where
red sandstone directly overlies the ore body. This crust
was not extracted, so that the losses in ore left in such
crusts represented 50% of general ore losses. It was calcu-
lated that over 1,000,000 tons were lost in this way. More-
over, 1,5-3 m thick layers were not exploited at all. These
experiments also showed that the protective ore crust did not
improve the safety of mining operations. When the red sand-
stone was exposed, its first layer fell, but the next layer
held fast and the whole massif remained solid for 6-7 months.

Card 1/2

Ore Crust

SOV-127-58-10-2/29
Deposits Without Leaving a Protective

Thus ore layers 1,5 to 6,5 m thick could be exploited without leaving the ore crust if the ceiling was regularly inspected after each shift. The reinforcement of such ceilings by beams 2,5 m long at 1 m interval permitted exploitation of ore layers of any importance with the least loss of ore. There are 5 diagrams, 1 photo and 1 table.

Making dense kaolin refractories at low firing temperatures. G. V. KUKOL'Y AND M. A. YALIMOVA. *Ogneupory*, 14 [11] 487-490 (1949).—The work was based on the use of MgCl₂ to accelerate the sintering of kaolin. A study of the physicochemical characteristics of the sintering process and an analysis of the phase diagram show that the acceleration is caused by the action of the MgCl₂ on the ability of the solid phase to sinter. The MgCl₂ should be added in amounts of 1.8 to 2% to the kaolin during the making of the briquettes which are to be fired for grog. For sufficiently dispersed kaolin, the method (plastic or semidry) of making briquettes has no effect upon the quality of the grog. In the case of coarsely dispersed kaolin, the plastic method should be used. The efflorescence of MgCl₂ during the gradual drying of plastic briquettes produces only a small difference in the sintering of different parts of the briquette and causes no defect in the external appearance of the shapes. Kaolin briquettes having an MgCl₂ admixture should be fired at temperatures up to 1300° to 1350°C. (2 to 6 hr.) instead of 1470° to 1500° without admixture. To obtain the most dense shapes, the mix should consist of 80% kaolin grog and 20% clay. Shapes should be fired at temperatures up to 1350° to have a porosity of 15 to 17%; this compares with 1400° to 1500° and 20% porosity without the admixture of MgCl₂. The admixture lowered the refractoriness by 30% but not the temperature of deformation under load (both starting and complete destruction); data on reheat shrinkage at 1400° and 1600° also show an improvement. Compressive strength was as high as 400 kg./cm.². Even the most dense brick withstands 20 heat-shock cycles (80° followed by water cooling). Results are tabulated and graphed.

MAKING DENSE KAOLIN REFRactories AT LOW FIRING TEMPERATURES

G. V. Kukolev and N. A. Yalymova. Ogneupory, 14 (11) 437 - 99 (1949).--

The work was based on the use of MgCl₂ to accelerate the sintering of kaolin. A study of the physicochemical characteristics of the sintering process and an analysis of the phase diagram show that the acceleration is caused by the action of the MgCl₂ on the ability of the solid phase to sinter. The MgCl₂ should be added in amounts of 1.3 to 2% to the kaolin during the making of the briquettes which are to be fired for grog. For sufficiently dispersed kaolin, the method (plastic or semidry) of making briquettes has no effect upon the quality of the grog. In the case of coarsely dispersed kaolin, the plastic method should be used. The efflorescence of MgCl₂ during the gradual drying of plastic briquettes produces only a small difference in the sintering of different parts of the briquette and causes no defect in the external appearance of the shapes. Kaolin briquettes having an MgCl₂ admixture should be fired at temperatures up to 1300° to 1350°C. (2 to 6 hr.) instead of 1470° to 1500° without admixture. To obtain the most dense shapes, the mix should consist of 80% kaolin grog and 20% clay. Shapes should be fired at temperatures up to 1350° to have a porosity of 15 to 17%; this compares with 1480° to 1500° and 20% porosity without the admixture of MgCl₂. The admixture lowered the refractoriness by 30° but not the temperature of deformation under load (both starting and complete destruction); data on reheat shrinkage at 1400° and 1600° also show an improvement. Compressive strength was as high as 400 kg./cm.². Even the most dense brick withstood 26 heat-shock cycles (800° followed by water cooling). Results are tabulated and graphed.

TITLE : The Problem of the Helminthic Fauna of Dogs of Certain Areas in the Far East

ORIG. PUB. : Tr. Khabarovskogo med. in-ta, 1957, Collection 15, 269-271

ABSTRACT : Of 53 dogs autopsied in Khabarovsk in 1953 helminths were found in 39-73%. Dipillidium caninum, Mesocestoides lineatus, Taenia hydatigena, Metagonimus yokogawai, Toxocara canis and others were most common among the 8 species of helminths recorded. Helminthic infestation of dogs in Kamchatka was found to amount to diphyllobothriasis and toxotrematosis.
